Chicago Board of Trade

BEST AVAILABLE COPY

Illustrated on the cover is an exciting new product recently developed by the Chicago Board of Trade. The product, Liquidity Data Bank (LDB), is basically a decision support system that will present a comprehensive array of information, far superior to current price series quotations. The information will be a breakdown of volume, within different markets, at each price level within time bracket during the trading.

The LDB tracks the trading activity of two broad categories of market participants—first, the commercial firms and pit traders who use the markets on a continuous basis during the trading day, and secondly, the outside public speculator, commodity pool, investment and commercial firm whose participation tends to be more selective and occasional.

The LDB supports the long range business plan presented by the Chairman of the Board of Trade, Leslie Rosenthal, by bringing a critical resource to the trading public—information. J. Peter Steidlmayer, Chairman of the Board's Market Information and Statistics Committee, states that the objective of the LDB is to "transport the pit to our customers through technological advances in telecommunication wherever they may in the world and give them the market feel that is so vital to successful trading."

The new product will more than fill the void created by the decision of the Commodity Futures Trading Commission to drop its monthly Position of Traders Report due to budgetary constraints.

Trading decisions in commodity markets are typically triggered by random 'market changing' information or the price movement of the commodity itself. The LDB presents a series of snapshots of how the major trading groups reacted to these unfolding and random events. Consequently, it reveals far more about the market biases and anxiety levels of the key market players than currently available through the typical vendor information service.

While the data is voluminous, the information on each trading day will be computer processed and distributed by 4 p.m. the same day. Transmission time will be optimized through the use of various high speed telecommunications links.

It is anticipated that the LDB will aid the performance of the public and commercial customers alike and thereby increase the money committed to the Board of Trade's futures markets.

This product was developed through the efforts of the following individuals and committees.

Chicago Board of Trade Statistics Committee
- J. P. Steidlmayer, Chairman
- S. Roller, Vice-Chairman
- Hollis Griffin
- Paul Gotskind
- Glenn Hollander
- Ruth Homer
- John Leckie
- Thomas Kelly
- Michael Poulton

Ad Hoc Committee for Development of Liquidity Data Bank
- J. P. Steidlmayer, Chairman
- Warren F. Smith
- John J. Conheeney
- David F. Goldberg

Statistical Annual 1981
Chicago Board of Trade
For The Year Ended December 31, 1981

ACKNOWLEDGEMENTS:

We express our appreciation to the following for their guidance and support:

To 1981 Statistics Committee: J.P. Steidlmayer, Chairman, Sam Roller, Hollis Griffin, Paul Gotskind, Glenn Hollander, Ruth Homer, John Leckie, Thomas Kelly and Michael Poulton.

To Staff Dan Rogers and Frank Chereck of Information Systems.

To CBT members, who have given us advice to improve the book.

Editor: Leslie Villarosa
Production Coordinator: Julie Barry
Introduction: Thomas Anderson
Support: Cathleen Cooke, Dorothy Davis, Daniel Eilers

Cover Design: Richard S. Prey

INTRODUCTION

The general downtrend in grain prices in 1981 can be attributed to bumper crop prospects coupled with slack demand and the high cost of money. These factors combined to reduce market participation by hedgers as well as speculators. Normally bullish speculators began to retreat from grain futures trading after the sharpest grain price declines in history occurred in December 1980. Hedgers also reduced their market participation due to high, volatile U.S. interest rates. Economic uncertainty on a global scale, America's political tension involving the Soviet Union–the largest grain importing country in the world–and fierce competition from other exporting nations were also key reasons inhibiting significant grain futures demand.

The exodus from grain futures, as an investment, stimulated trade in higher yielding government, corporate and money market securities in 1981. The effect was a crop of about 10% in the Chicago Board of Trade grain and soy complex volume in 1981 from 1980. Corn and soybeans, historical leaders, gained substantial year-to-year volume through September but then lost steam near year's end. Wheat's inability to post any monthly volume increases hurt the overall total most.

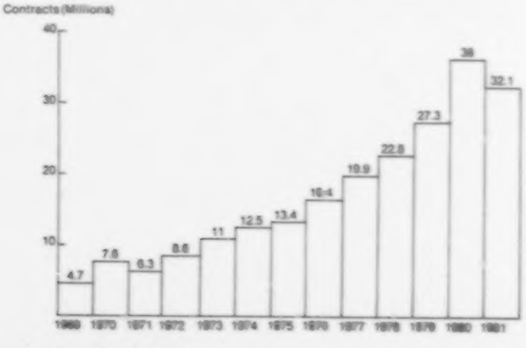
PLANTINGS, DEVELOPMENT AND WEATHER

The USDA lists the official crop year for major Chicago Board of Trade active contracts as follows: Corn, October through September; wheat, June through May; and soybeans, September through August. Each crop has different developmental needs but adequate moisture and other weather conditions are mutually vital.

USDA statistics indicated record winter wheat seedings of 63.9 million acres at the start of 1981. Market interest in January centered on the lack of subsoil moisture after 1980's drought and the unusually warm, dry 1980-81 winter.

Ideally, winter wheat needs sufficient moisture along with a cover of snow during the crop's dormant stage. Without adequate snow cover a quick freeze could ruin the crop. Subsoil moisture conditions also affected planting intentions for corn and soybeans last spring. Scattered precipitation fell irregularly through March but many analysts believed the moisture levels across the southwest wheat belt and the midwest corn belt were still insufficient.

Total CBT Agricultural Contracts Traded (Standard CBT Contracts for Wheat, Corn, Oats, Soybeans, Soybean Oil, Soybean Meal) 1969-1981



(Source: Chicago Board of Trade)

In mid-March, the USDA released it's prospective plantings report for the 1981 corn and soybean crops. The survey indicated producer intentions to plant 69.8 million acres of soybeans and nearly 84 million acres of corn. The figures were lower than actual 1980 levels, but analysts agreed the intentions were reasonable considering the weakness in the corn/soybean price ratio and the low moisture in the western corn growing regions. Weather conditions were still the most important influence between the intentions report and mid-May. Renewed public interest surfaced at the start of April as rain in major corn and soybean regions remained light and prospects for reduced crop output seemed likely. A mid-month onset of continuous rains, however, washed out new demand as water levels in dry corn and soybean regions rejuvenated. These timely rains also aided the development of winter wheat as analysts began to estimate production at more than 2 billion bushels. The outlook for Chinese and Russian crops also showed improvement during early spring. The Soviet Union had good snow cover and China received plentiful rains. South American crops also experienced ideal weather through the entire growing season, with record corn and soybean crops expected to meet Soviet import requirements.

In the U.S., heavy rains continued in major corn and soybean belts through May and a new round of speculative demand swept the markets. Analysts expressed concern that soggy field conditions in eastern corn regions might cause a switch to soybean planting or short-season corn. Short-season corn typically produces 15-25% lower yields.

Wheat prices, meanwhile, rallied prior to seasonal pressure in June as severe storms in some southwestern states impeded harvest action. A USDA acreage report released in late June unexpectedly projected a reduction in soybean planted acreage and an increase in corn acreage. Most traders at

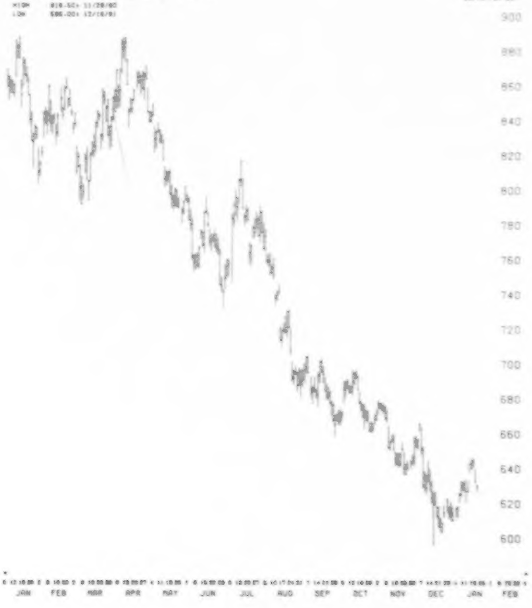
the Chicago Board of Trade had anticipated the reverse. The soybean market responded with a price rally into mid-July before starting a steady decline which would last through the end of the year. Adding impetus to the mid-year surge were reports that Russian crops might be in worse condition than previously thought, with total grain output possibly below 200 million tons. Russian grain output at the start of the year was targeted by the communist government at 236 million tons. USDA's final Soviet grain production estimate for 1981 was 175 million tons with import capabilities of 43 million tons. The collapse of favorable Soviet crops prospects stimulated futures buying but eventually the outlook for huge American crops dampened the enthusiasm. Prices continued to slide through August as unseasonable rain generated a healthy growing environment for corn and soybeans. Trade attitudes varied in mid-September on talk of early frost. Analysts were concerned that the eastern corn region, particularly Indiana and Ohio, would suffer most if an early frost hit because of late plantings subsequent to heavy spring rains. Light frost through harvest and some delays caused by rain sparked only small futures price moves through October as the near perfect growing season came to an end.

The ample rains through 1981 left soil moisture ideal for the 1981-82 winter wheat as USDA statistics in December indicated a record 66.3 million acres seeded.

U.S. vs. USSR

Optimism prevailed in grain futures markets prior to the presidential inauguration of Ronald Reagan since one of his campaign promises was an end to the year-long embargo on agricultural exports to the Soviet Union. The market was saturated with embargo rumors through April but most

Soybeans, January 1982



Source: Commodity Perspective, Inc.

interest centered on Poland. Concern was that the Soviet Union might intervene to quell social and political unrest in that country, similar to the situation in Afganistan. Analysts believed this type of invasion would surely strain U.S./Soviet relations and ultimately lead to a furthering of the embargo. Grain prices reacted adversely to each new disturbance in Poland and vice versa during tranquil times as events in the eastern bloc nation became daily news. Finally, on Friday April 24, 1981 the embargo was officially ended. Market reaction was rather anticlimactic and grain prices succumbed to a temporary sell-off. The next political move was to re-open trade through the creation of a new grain sales agreement. The then current five year grain sales agreement between the U.S. and Soviet Union was due for expiration on September 30. Initial talks in Vienna during June failed to stimulate the market because Agriculture Secretary John Block could not assure American grain dealers that the Soviets would buy U.S. grain. In fact, stepped up purchases of South American grain and oilseed by the Soviets caused great concern that America would become a "supplier of last resort." As a sign of goodwill, prior to the second exploratory grain sales talk at the start of August, the Soviet Union made their first American grain transaction in more than one year and bought 450 thousand tons of corn. The August talks resulted in a one-year extension on the old five-year agreement and set minimum Soviet purchases at 6 million tons, with an option to buy up to 2 million more. Market reaction again reflected disappointment with the agreement since expectations had been based on a 12 million ton offer. More U.S. offers in October to supply the Soviets an additional 10 million tons of grain had already been discounted in the market as most analysts believed the Soviets would need to import all they could get regardless of source. Without an embargo proof clause in the new trade agreement, Soviet purchases through the end of the year remained piecemeal. Prices continued to weaken through December as the result of slow Soviet demand and the Reagan administrations inability to compromise a new long term grain sales agreement. Imposition of martial law in Poland during December renewed fears of a new Soviet grain embargo and grain prices fell to 1981 lows in hectic trading action.

SUPPLY/DEMAND

The USDA reported some record crop production figures in the final 1981 estimate released in November. Corn for grain registered an all-time high of almost 8.1 billion bushels and all-wheat produced a record 2.75 billion bushels. Soybean production for 1980 was the second highest in history at 2.08 billion bushels. Revised production figures released in January 1982 raised corn production to 8.2 billion bushels and lowered soybean production to 2.03 billion bushels.

Slight variations in figures between crop reporting months caused minor price movements through the season, but near the end of August the markets fully reflected the size of the 1981 crops.

The government's proposal for a voluntary 15% wheat set-aside program failed to attract producer interest and winter wheat growers seeded a record 66 million acres during early fall. Analysts said high winter wheat seedings typically result in larger spring wheat seedings and corn planting intentions for the new crop year. This compounded the bearish outlook that major grain stocks were due for another rise in 1982.

Bumper production of corn, wheat and soybeans coupled with slack export demand resulted in rising USDA carry-over projections through most of 1981. Wheat ending stock projections, January-April, showed slight increases because of a reduction in the estimated use of wheat as a feed. Corn stocks also rose mainly because of feed-use reduction and a decline in exports. Analysts noted that livestock breeding turned unprofitable, reflecting a consumer preference for leaner beef as well as higher inventory carrying costs. As livestock breeders cut production, demand for feed declined.

Prices for the 1980-81 soybean crop also suffered as world-wide demand for the oilseed declined and carryover edged upwards with a larger U.S. crop offsetting a smaller Chinese crop. Increased export registrations of Brazilian soyproducts and record soybean production throughout South America continued to depress American exports during the start of the new year.

Corn and soybean export projections dropped from May through August and wheat export projections rose as trade attention focused on new crop prospects. Official reductions in wheat output May through June was the result of freeze over much of the central U.S. However, damage analysis in later reports coupled with good output of spring and durum crops kept production estimates at record highs through the summer. Renewed trade with the Soviet Union lowered carryover projections, despite the rise in output, as analysts believed the Soviets would aggressively import wheat due to poor crop prospects. Indications that India had import intentions for 5 million tons of wheat also kept the carryover outlook in a downtrend. Lowered ending stocks of corn May through July was attributed to a 3% rise in feed usage, coupled with lowered production forecast. Yields in eastern corn regions were expected to decline after late spring plantings. However, the August crop report surprised analysts and raised corn production 600 million bushels to 7.73 billion. The month-to-month increase was the largest in crop reporting history. The first official estimate for soybeans, also released in August, indicated a 2.02 billion bushel crop which was higher than most analysts expected. The subsequent rise in corn and soybean carry-over was compounded by yet another drop in export projections. Unprofitable crushing margins kept soyoil and soymeal production steady through the last half of the 1981, but export projections dipped for meal and rose for soyoil. Analysts attributed the brightened soyoil outlook to unchanged forecasts in export availabilities of competitive fats and oils.

Little change occurred the last four months of the year concerning the supply/demand trend for corn. Continued increases in production estimates and steady declines in export projections paved the way for higher 1982 carry-over. Wheat became cheap relative to corn as a feed and the subsequent rise in feed projections for 1981-82 moved wheat ending stocks lower despite a stagnated export outlook. The American soybean became a good buy after the start of the 1981-82 crop year. Carry over projections peaked in September then tumbled as a result of lowered production estimates and increased exports. At the end of 1981, soybean exports were ahead of year earlier levels by almost 70 million bushels as crush capacity expanded overseas.

Other factors affecting demand for American grain were worldwide and domestic economic conditions. High U.S. interest rates, strong dollar values abroad and global economic troubles all combined to depress the marketing of U.S. agricultural goods.

ECONOMICS OF MONEY IN AGRICULTURAL MARKETING

When inflation in the U.S. is high, the Federal Reserve Board can attempt to control the situation through monetary policy. The Fed will tighten the supply of loanable reserves to banks creating a scarcity of money. As money tightens, the interest rate to borrow rises, producing higher costs for three important money users: grain importing countries, U.S. exporting firms and individual investors.

As U.S. interest rates firm, the value of the American dollar becomes more expensive. Grain importing countries must watch closely for suitable exchange rates to get a better buy on American imports.

The dollar remained at such high levels against major foreign currencies in 1981 that few opportunities existed for long term supply investments. The Common Market, one of the largest importers of American agricultural products, was hit the hardest and followed a pattern of "hand-to-mouth" buying through most of 1981. Competing exporting nations, without exchange rates pegged to the dollar, easily undercut American prices by devaluing their own currency. For example, American soybean exports dropped over 20% in 1981 from 1980 while total Brazilian and Argentine soybean exports increased almost 40% and soymeal rose about 50%. The American soycomplex market was hurt the most by strong dollar values in 1981 because major corn and wheat importers, particularly the Soviet Union, had no exchange rate and usually sold gold or oil to raise dollars.

U.S. exporters were confronted with another problem other than declining overseas demand in 1981. High interest rates compounded the cost to store and carry inventory, keeping domestic commercial action erratic. Many exporters short-supplied foreign sales then raised basis levels to unseasonable points prior to commitments for delivery. High interest rates also dampened speculative participation in grain futures as securities and money market funds, offering high interest rates with less risk, drew more attention. The individual farmer also suffered from high costs of operation resulting in lower average farm prices for raw agricultural commodities throughout 1981.

After mid-year the U.S. was on it's way into a recession. Recessions have historically pressured grain prices and 1981 was no exception. High unemployment results from recessionary times and this in turn reduces strong demand for many agricultural products. The European community also was stung by a recession with unemployment there topping 8% late in the year.

Section 1
Futures Prices
Volume of Sales
Open Contracts

Price is a composite reflection of the changing ratio of supply and demand. Historical price data, supplemented by data on the availability and consumption of a commodity, allows commercial and speculative users of futures markets and other students of commodities trading to gain deeper insight into the dynamic nature of futures trading.

On the following pages you will find a complete listing of the high, low and closing futures prices of CBT commodities for each trading session during 1981. Additional tables of weekly, monthly and annual ranges of price—from high to low—provide a quick glimpse of price volatility.

Data on futures trading volume and open contracts (the number of futures contracts not yet closed out by delivery or an opposite transaction) are measures of the strength and liquidity of our markets. These measurements are often analyzed in conjunction with price movements to predict future price trends.

Section 2
Cash Prices

Futures prices represent the market's best assessment of the probable cash value of a commodity at a future date. Futures prices tend to follow the movement of cash prices and as a result, traders in commodity futures watch cash prices closely. Cash commodity prices are influenced by the prices of substitutes and the demand for products using the commodities as inputs.

This section contains daily, weekly and monthly cash prices for CBT commodities in Chicago and other principle market centers. Also presented are weekly and monthly cash prices for meals and oils competing with the soybean complex and selected livestock feed/price ratios which indicate the derived demand for grains used in feed.

Section 3
Shipments Receipts

Physical location of commodities in relation to the place where they are in demand is a critical factor in the making of both cash and futures prices. This section contains reports from the U.S. Department of Agriculture, terminal elevators and transportation agencies which show the physical location and movement of visible stocks in both CBT and related commodities for Chicago and other market centers.

Historical data on the movements of commodity stocks is arranged by mode of transport as well as location.

[1] Census report data to Canada overstated since Canada contains major transit ports and ultimate destination was unknown at time of shipment.

Transhipment through Canadian ports are mainly for Western Europe and Asian Countries. Census data to these countries are understatedly the amount of transhipment via Canada.

Section 4
Supply and Disposition
Miscellaneous Data

In this section the reader will find data on the production and consumption of commodities for a period of years. Reports include those from the U.S. Department of Agriculture detailing acreage, production and yield of major crops by state. Other reports from the U.S. Census Bureau detail the monthly processing of the major oilseeds and stocks of refined products.

United States agriculture competes with hundreds of commodities from around the world. This section contains historical data on world-wide production and consumption of the major feed grains, which has an impact not only on pricing and profits in the agricultural sector, but also on the U.S. position in the international economy.

The production and consumption of non-agricultural commodities is fully detailed as well.

[1] Beginning with the 1974-75 season, the crop year for wheat, oats, rye and barley is June 1-May 31. Prior to the 1974-75 seasons, the crop year for these grains was July 1-June 30.

[2] No support programs was implemented for the 1975 soybean crop.

Source: Feed situation, wheat situation, crop production, fats & oils situation.

[1] Seasonally adjusted annual rates.

NOTES: Private building permits for (14,000 areas with permit systems, excluding farm), starts and completion are Census Bureau date. A dwelling unit is started when excavation begins. In the case of apartment building, all units are considered started at that time; however, all such units are considered completed when more than half of the units in the structures are ready to use. Private mobile home shipments are Mobile Home Manufacturers Association data converted to seasonally adjusted annual rate of Census Bureau.
